Water Shed Technology™
BY PHIFER

AN OVERVIEW

What is Water Shed Technology™?

Water Shed Technology (a.k.a. WST) is a proprietary hydrophobic coating that is applied to select Phifer screening products during the manufacturing process.

What does hydrophobic mean?

In simple terms, it is the property of a substance that repels, thus does not absorb water.

How does it work?

Phifer screening products with WST virtually eliminate window paning, a process whereby water fills the open squares in the screen during a rainstorm. With Water Shed Technology, the rain water beads up and rolls off the screen, taking debris with it, thus, keeping your view clear, even during a rainstorm.

How long does WST remain on the screens?

The durable hydrophobic coating will not wash off once applied during our process.

What other benefits do I get from screening products with WST?

Because screens with WST stay cleaner longer, you can enjoy increased life expectancy of the material.

Does this mean I don't have to clean my screens as often?

Yes. The WST prevents dirt and grime from remaining on your screens and reduces the number of times your screens need to be cleaned.

What other products use hydrophobic-type technology?

Two common products that use hydrophobic technology are wood deck water sealers and glass windshield rainwater repellants.

Which Phifer products have WST?

Currently, Phifer's BetterVue® and UltraVue® 2 are produced with WST. For the most current list of products or learn where to buy, please contact your Phifer sales or customer service representative or visit phifer.com.
